

qEEG

for psychiatry and psychology

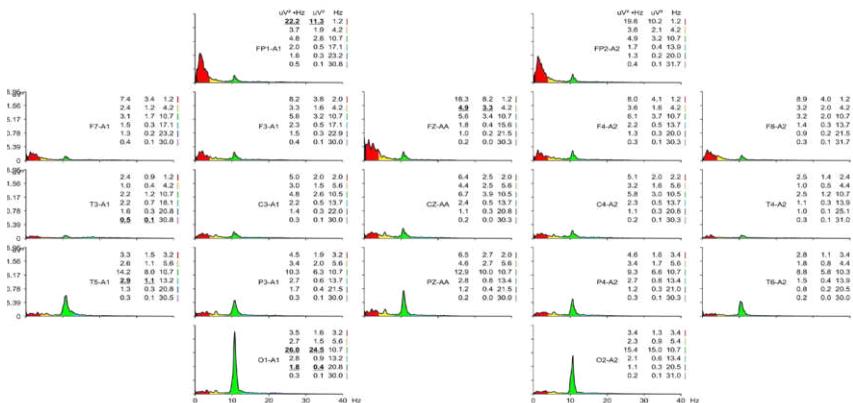

Quantitative electroencephalography (qEEG) is mathematical transformation EEG waves into frequency-time field and search specific markers of brain and mental status.

- measure of personal brain activity
- markers for cognitive and psychiatry problem detection
- markers for individual biofeedback program
- markers for differential classification according ICD-10 F01–F09

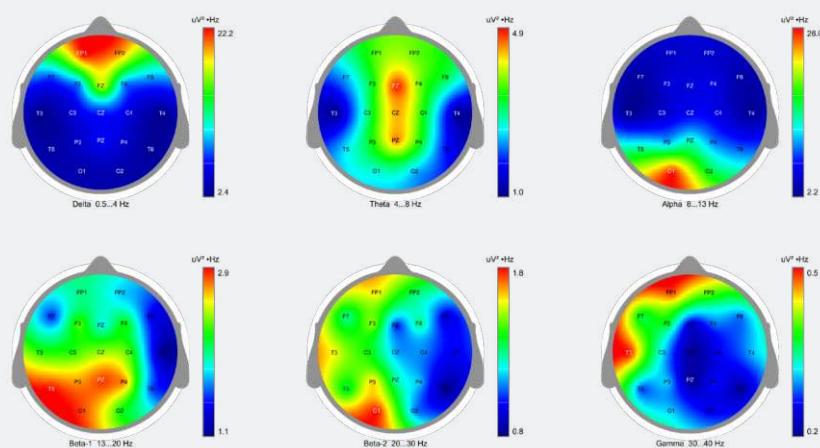

Native EEG

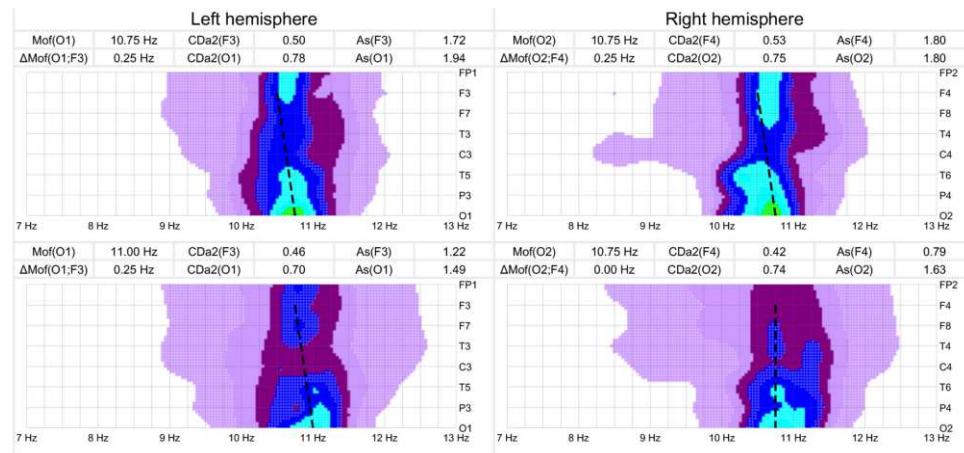

Spectras by electrodes

Maps by frequency bands

DAFCAR

DAFCAR compares the deviation of the alpha-rhythm spectrum from the normal distribution and assessment of mental health on base analyze of two values: Neurophysiological Cognitive Level and Neurophysiological Stressresistance Level. Used 6 min test with hyperventilation stage.

Atlas of EEG alpha rhythm cartograms for diagnosing mental disorders according to ICD-10 F01–F09. This is statistical analysis of 14,000 EEGs obtained during psychiatric examination.

Neurophysiological cognitive level (NCL)	Neurophysiological stressresistance level (NSL)			
	Norm	Slight decrease	Moderate decrease	Significant decrease
Critical decrease	Significant deviation	Significant deviation	Significant deviation	Significant deviation
Significant decrease	Significant deviation	Significant deviation	Significant deviation	Significant deviation
Moderate decrease	Moderate deviation	Moderate deviation	Moderate deviation	Endogenous psychopathology
Slight decrease	Mild deviation	Moderate deviation	Moderate deviation	Endogenous psychopathology
Norm	Mentally healthy	Mild deviation	Moderate deviation	Endogenous psychopathology
Above norm	Mentally healthy	Mentally healthy	Mild deviation	Endogenous psychopathology

Spectral categories

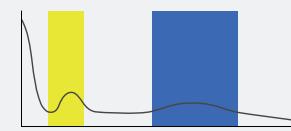

Pre-defined spectral EEG patterns are an indicator of functional reservation (severity of thalamocortical deafferentation).

It can be used to predict brain recovery after severe brain injuries.

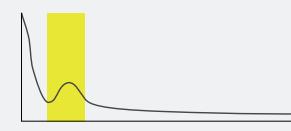

Full integrity (alpha 8–12 Hz and beta 15–40 Hz)

Normal tonic firing of the thalamus and normal resting cortical oscillations.

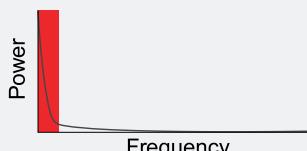

Thalamo-cortical dysrhythmia (co-localized theta 5–7 Hz and beta 15–40 Hz)

Deafferented thalamus fires in burst mode and the afferent volley of synaptic activity is received by relatively intact neocortical regions.

Severe deafferentation(theta 5–7 Hz)

Severe structural brain injuries of varying etiologies.

Complete functional deafferentation (delta <4 Hz)

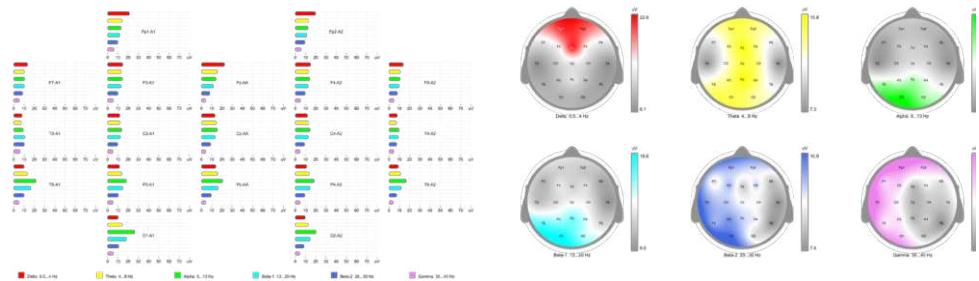

Negative prognosis for brain recovery.

Average amplitude analysis

Average amplitude values for each of the EEG ranges and their spatial distribution.

Global Field Synchronization

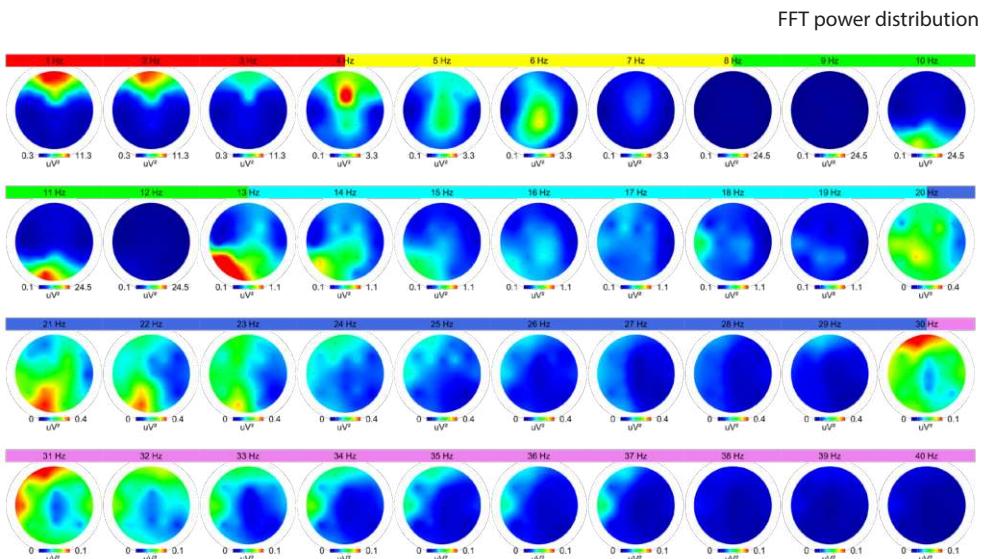

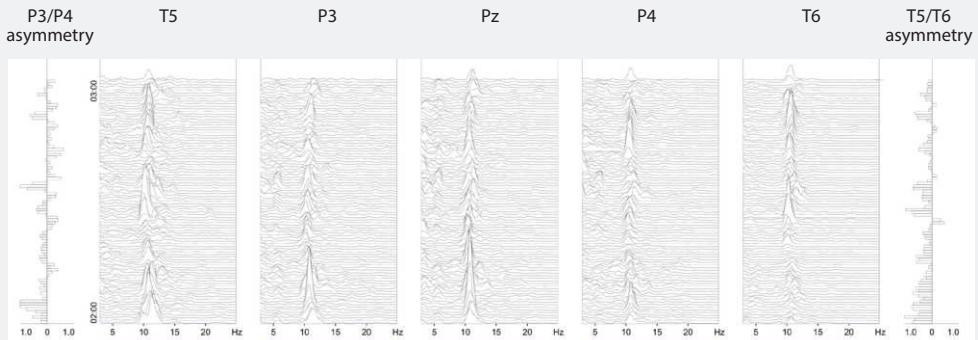

An indicator of spatial connectivity of brain processes by coherence of EEG oscillation phases for all leads.

Koenig T, Lehmann D, Saito N, Kuginuki T, Kinoshita T, Koukkou M. Decreased functional connectivity of EEG thetafrequency activity in first-episode, neuroleptic-naïve patients with schizophrenia: preliminary results. Schizophr Res. 2001 May 30; 50(1-2):55-60. doi: 10.1016/s0920-9964(00)00154-7. PMID: 11378314.

Brain symmetry index

Pairwise derived brain symmetry evaluates asymmetry along homologous channel pairs for the EEG spectrum power in the range from 1 to 30 Hz. Severe EEG asymmetry indicates organic brain injuries.

Devices

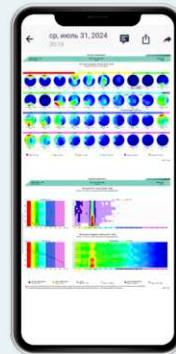

NeoRec21 or NeoRec21 mini for mobile qEEG with cloud database.

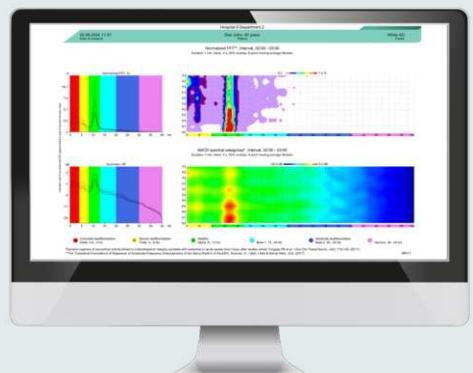

NVX24, NVX36 or NVX52 for stationary qEEG on Windows PC and standalone software.

NEUROvisor mobile iOS and Android apps are ready for smartphone or tablets. Routine EEG possible too. Really, it's a lab in your pocket.

A stationary solution for clinics with the possibility of expansion as routine EEG, evoked potentials, Event-Related potentials, biomedical research.
